How to use this guide

These commands (also called modifiers or tags) are short instructions you add to your prompts to control quality, lighting, camera, style, and mood. They work especially well with Nano Banana, Gemini image models, and many other modern AI image generators.

How to use them: Simply add the command at the beginning or end of your prompt. Example: /cinematic /4k a minimalist perfume bottle on dark background

You can combine multiple commands. Start with 1–3 and experiment. The goal is control, not stuffing every tag possible.
